

ZT1090 MID Conversion Kit (for YOKOMO MD9)
BD9 MID
ConversionKit

This product is a conversion kit based on the YOKOMO BD9. The purpose of development is to reduce the time lag at the time of throttle operation as much as possible by eliminating the difference in belt length between front and back. As a result, the motor is laid out on the center side, enabling a balanced midship layout to be realized.

In addition, with the recent evolution of the battery, we have also made possible the layout of chassis balance priority using short lipo battery. (Optional parts are required to install the short lipo battery.)

This kit is a conversion kit.

You will need YOKOMO BD9, a complete set of RC equipment, body, tires, batteries, etc. by the time you drive. The image is a prototype, equipped with optional parts.

Please note that the specifications are subject to change without notice.
